chin that have become hollow or thin due to weight loss or age-related issues, boosting overall facial definition.

The Sloane Clinic uses the Juvéderm Voluma – the latest generation of hyaluronic acid facial volumiser that provides even greater facial volumising effects and longer lasting results thanks to the compound's special particle size and smoother texture. In a clinical study of patients treated just once with Juvéderm Voluma, almost two-third reported a significant boost in facial

plumpness. Almost 70 per cent described their facial volume as "very good" during the six to 18 months following the treatment.

For enhanced results, the lifting and sculpting treatment can be combined with skin-tightening procedures such as Ulthera and Thermage, and skin rejuvenation treatments such as Intense Pulsed Light and Laser Toning to achieve even better results. The entire procedure takes about 30 to 45 minutes and starts with the doctor first examining the face to tailor the treatment to individual needs. A topical cream is then applied to numb the skin before the Juvéderm Voluma is injected to ensure maximal comfort. Individuals with a busy work schedule or social life will enjoy the no downtime treatment as the Juvéderm Voluma starts to work straightaway to fill and contour your face naturally. Instantly, you will notice that your wrinkles have improved, and your face is more contoured and subtly lifted. The improvements are expected to continue gradually over time as the hyaluronic acid further stimulates more collagen production. After two to three weeks, you will find that your skin is firmer, with better texture and elasticity. However, just like the body's own hyaluronic acid, Juvéderm Voluma is broken down naturally by the body over time, but with proper diet intake, adequate rest and regular exercise, the effect is said to last up to 18 months. The latest treatments aside, doctors at The Sloane Clinic also accord priority to the patients' well-being and take the time to carefully explain each procedure, inform them of safety issues, and advise them on the best time to repeat the procedure to maximise effects of the treatment.

The perfect LIFT

THE SLOANE CLINIC continues its noble mission of keeping faces youthful with its new non-invasive facial recontouring treatment as it celebrates the opening of a spectacular new clinic at Marina Bay Sands

Hyaluronic acid is one of the body's natural wonders. It is responsible for collagen synthesis to repair and maintain naturally supple skin. However, as we age, the amount of hyaluronic acid our body produces decreases, leading to skin sagging and thinning, and a more sallow appearance, making an individual appear older than they may really be.

Hyaluronic acid is a key component of the Voluma High Definition Lift, the latest in The Sloane Clinic's repertoire of aesthetic treatments, medical facials and body-facials available at five locations in Singapore, including the latest at Marina Bay Sands.

The aim is to ensure that anyone who steps into the clinic gets all the help they need to maintain a visage consistent with their youthful energy while side-stepping the scalpel.

In Voluma High Definition Lift, hyaluronic acid is injected beneath the skin to firm up skin, lift sagging visages and recontour faces. Sagging jowls, nasolabial lines and unsightly hollows under the eyes will be noticeably improved with the lift, while facial lines and wrinkles will be visibly reduced. In addition, the treatment's contouring action helps restore volume to sagging cheeks, cheekbones and
